

APPENDIX B: TRANSPORTATION

The following table lists major roadway segments along with information concerning functional classification, number of lanes, pavement condition, average daily traffic (ADT) and 1997 crash frequency.

Roadway Functional Classification Definitions

I. URBAN DESIGNATION:

The four functional systems for urban and urbanized areas are: 1) principal arterials, 2) minor arterials, 3) collector streets, and 4) local streets.

1. The **urban principal arterial** system of streets and highways serves the major centers of activity of a metropolitan area, the highest traffic volume corridors, and the longest trip desires. The system carries a high proportion of the total urban area travel on a minimum of mileage. The system is integrated, both internally and between major rural connections.

The principal arterial system carries the major portion of trips entering and leaving the urban area as well as the majority of through movements to bypass the central city. In addition, significant intra-area travel, such as between central business districts and outlying residential areas, between major inner city communities, or between major suburban centers is served by this system. Frequently, the principal arterial system will carry important intra-urban as well as inter-city bus routes. Finally, this system in small urban and urbanized areas provides continuity for all rural arterials that intercept the urban boundary.

2. The **urban minor arterial** street system interconnects with and augments the urban principal arterial system and provides service to trips of moderate length and a somewhat lower level of travel mobility than to principal arterials. This system also distributes travel to geographic areas smaller than those identified with the principal arterial system. The urban minor arterial street system includes all arterials not classified as a principal arterial, contains facilities that place more emphasis on land access, and offers a lower level of traffic mobility. Such facilities may carry local bus routes and provide intra-community continuity, but, ideally, should not penetrate identifiable neighborhoods. This system includes urban connections to rural collector roads where such connections have not been classified as urban principal arterials.

3. The **urban collector street** system provides land access service and traffic circulation within residential neighborhoods, commercial, and industrial areas. It differs from the arterial system by penetrating residential neighborhoods and distributing trips from the arterials through the area to the ultimate destination. Conversely, the collector street also collects traffic from local streets in residential neighborhoods and channels it into the arterial system. In the central business district and in other areas of like development and traffic density, the collector system may include the street grid that forms a logical entity for traffic circulation.

4. The **urban local street** (local roads) system comprises all facilities not on one of the higher systems. It serves primarily to provide direct access to abutting land and the higher

systems. It offers the lowest level of mobility and usually contains no bus routes. Service to through traffic movement usually is deliberately discouraged.

II. RURAL DESIGNATION:

Rural functional classes are in the areas outside of urban areas. These areas include many small towns that have a population of less than 5,000. The classes are similar to the urban functional classes. The differences in the nature and intensity of development between rural and urban areas cause these systems to have characteristics that are somewhat different from the corresponding urban systems. Rural functional classes consist of: 1) principal arterials, 2) minor arterials, 3) major collectors, 4) minor collectors, and 5) local streets.

1. The **rural principal arterial** system consists of a network of continuous routes that serve corridor movements, with trip length and travel density characteristics indicative of substantial statewide or interstate travel. It serves virtually all-urban areas with populations of 50,000 and above. Rural principal arterials provide an integrated network without stub connections, except where unusual geographic or traffic flow conditions dictate otherwise.

2. The **rural minor arterial** system forms a network linking cities, larger towns, and other traffic generators, such as resort areas capable of attracting travel over similarly long distances. Minor arterials, spaced at intervals consistent with population density, ensure that all developed areas of the state are within a reasonable distance of an arterial highway.

3. The **rural major collector** system serves the larger towns not directly served by arterials and other traffic generators of intra-county importance.

4. **Rural minor collectors** are spaced at intervals consistent with population density, collect traffic from local roads, and serve the remaining smaller communities.

5. **Rural local streets** primarily provide access to adjacent land and provide service to travel over relatively short distances, as compared to collectors or other higher systems. These streets are not eligible for federal funds.

LOS Standard Based upon GRTA Technical Guidance for DRI Review (effective January 14, 2002). No LOS Standards are currently established by GDOT

[1] Pavement Condition:

- 81-99 or A = No Maintenance Necessary,
- 65-80 = Some Minor Repairs Needed,
- 45-64 = Considerable Deterioration,
- 28-44 = Badly Deteriorated,
- 11-27 = Critical Condition.

LOS Standard Based upon default values included in the GRTA Technical Guidance for DRI Reviews (effective January 14, 2002). No LOS Standards are currently established by GDOT

[1] Pavement Condition:

- 81-99 or A = No Maintenance Necessary,
- 65-80 = Some Minor Repairs Needed,
- 45-64 = Considerable Deterioration,
- 28-44 = Badly Deteriorated,
- 11-27 = Critical Condition.
